Your task is to write an application (React, preferably TypeScript) to generate forms based on a specified JSON configuration.
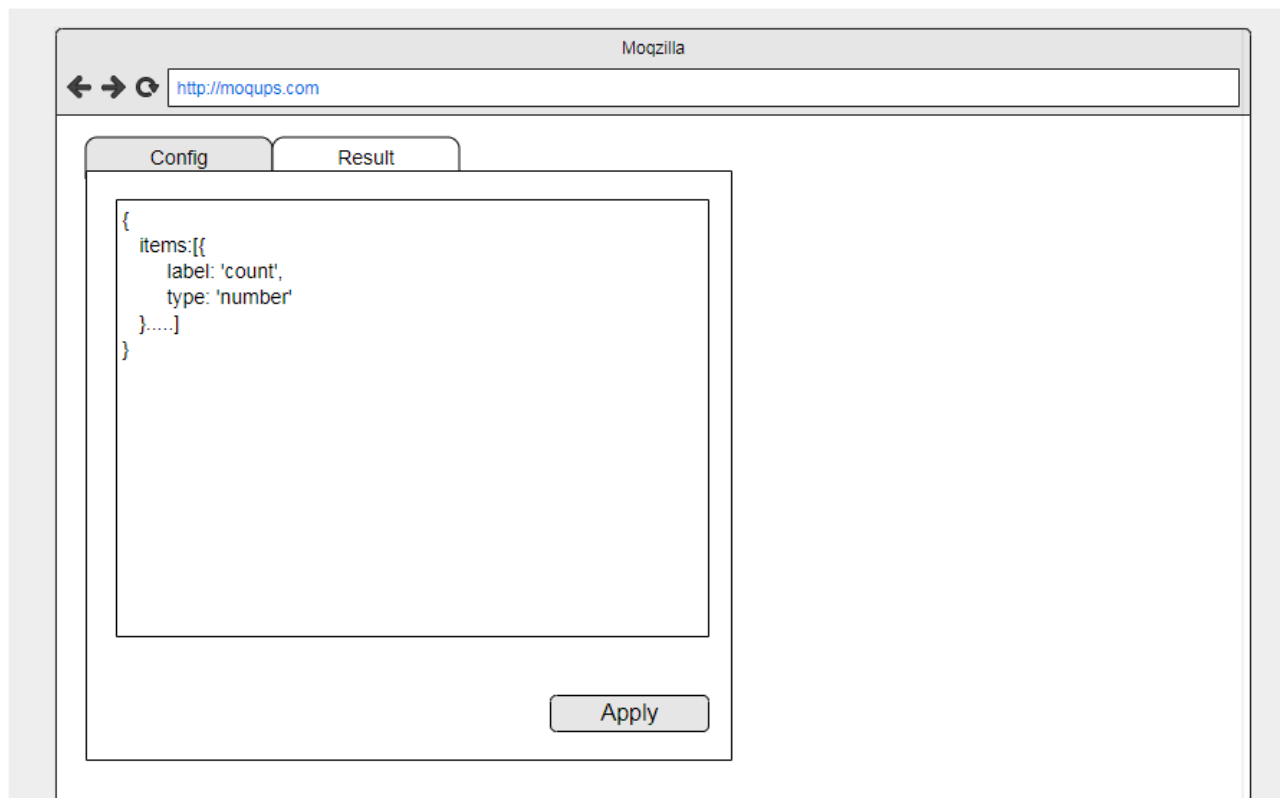

This application will consist of two tabs:
Config – to enter the form configuration in JSON format Result – to display the form

The application should be able to generate forms containing any number of fields. These fields could be of the following types:
- numeric (number field);
- string (text field);
- multi-line (text area);
- boolean (checkbox field);
- date (date field);
- enum (radio buttons).

The application should also be able to set the title of the form, as well as the number and text of the buttons (for example, OK, Cancel, Apply).
